

ABSTRACT

A retractable seat may include a seat cushion, a seat back rotatably supported on the seat cushion, and a link mechanism for supporting the seat cushion on a floor. The link mechanism includes a front leg and a rear leg that are pivotally connected to the seat cushion and the floor so that the seat cushion and the seat back can be switched between a use condition and a retracted condition. The seat may further include a restraint mechanism provided on the floor for preventing the link mechanism from moving when the seat is in a use condition.
